

Project Brief: JobTrack - Job Application Tracking System

Week 3 Project Selection Evidence | Prepared by Trinh Hieu Tran | 09 August 2026

Project name	JobTrack - Job Application Tracking System
Project type	Local web application for tracking job applications and related activities
Primary users	Job seekers, students, graduates, migrants, and career changers
Technology direction	React frontend, ASP.NET Core backend, PostgreSQL database, Entity Framework Core

Background and Problem

Job seekers often apply through multiple platforms such as SEEK, LinkedIn, Indeed, company websites, referrals, and email. After several applications, it becomes difficult to remember which companies were contacted, which resume version was used, which applications need follow-up, and what stage each opportunity has reached.

Project Goal

The goal of JobTrack is to provide one private workspace where users can record job applications, track status changes, manage interview and follow-up information, and review their job search progress through simple dashboard summaries.

Core Features

- Application tracker: create, view, edit, archive, search, and filter application records.
- Status tracking: update applications through stages such as Applied, Interview, Offer, Rejected, Withdrawn, and Archived.
- Document tracking: record resume version, cover letter version, portfolio link, or GitHub link used for each application.
- Interview and follow-up management: store interview dates, contact details, follow-up dates, reminders, and notes.
- Dashboard summaries: show active applications, upcoming interviews, overdue follow-ups, status counts, platform counts, and outcome summaries.

MVP Scope

- User registration/login and private user workspace.
- Manual entry of job application records.
- Basic application status workflow and validation rules.
- Simple dashboard for application totals and follow-up visibility.
- Local execution only using one shared project repository.

Out of Scope for First Version

- No external job-board API integration or automated job scraping.
- No production deployment in the first version.
- No mobile app version for iOS or Android.
- No automated email or SMS notification service.

Expected Project Deliverables

- Working local web application with React, ASP.NET Core, and PostgreSQL.
- Business requirements documentation, user stories, and diagrams.
- Database design, sample data, and setup notes.
- Test cases, testing evidence, weekly reports, and final presentation.
