Unit: Software Engineering Practice

Meeting Topic: Role-Specific Learning and Tool Installation

Attendees

- Trinh Hieu Tran
- Pooja Tiwari
- Prince Kumar Sah

Meeting Purpose

The purpose of this meeting was to discuss each member’s role responsibilities, identify what each role should contribute to the project, and review the tools required for role-specific work. The group also discussed how Jira organises work using stories and tasks, but no Jira stories or tasks were created during this meeting.

Agenda

- Review each member’s selected primary and secondary roles.
- Discuss what each role is expected to do.
- Identify tools needed for each role.
- Discuss Jira story and task structure.
- Confirm Week 2 individual evidence for GitHub and timesheets.

Discussion Summary

The group reviewed the role allocation and discussed how each role contributes to the project. The Developer and Database Administrator roles were discussed as technical roles responsible for implementation, database design, local setup, and integration. The Business Analyst and Report Analyst roles were discussed as documentation-focused roles responsible for requirements, user stories, project reports, and presentation material. The Tester and Data Analyst roles were discussed as quality and analysis roles responsible for test cases, validation, sample data, and dashboard/reporting ideas.

The group also discussed the required tools for role-based work. Development tools included VS Code, Visual Studio, Docker, and database tools. Documentation and analysis tools included Jira, Microsoft Office, diagrams tools, and reporting tools. Testing tools such as Postman and browser developer tools were also discussed as useful for later weeks.

The group reviewed the basic Jira structure. Members discussed that a **story** usually represents a user-focused requirement or feature, while a **task** represents a smaller piece of work needed to complete that story. The group agreed that Jira could later be used to organise backlog items, assign work, and track progress. No stories or tasks were created yet because the team was still focusing on understanding roles and tools.

Role Discussion

	≡ Role Pair	≡ Responsibilities Discussed
1	Developer + Database Administrator	Build application features, set up local development environment, design PostgreSQL database, create models/tables, and support backend/frontend integration.

2	Business Analyst + Report Analyst	Define requirements, prepare user stories, support BRD documentation, maintain weekly reports, and prepare final presentation material.
3	Tester + Data Analyst	Prepare test cases, check application behaviour, validate data, prepare sample data, and support dashboard/reporting insights.

Jira Discussion

The team discussed how Jira can organise project work:

- **Story:** a user-focused requirement or feature.
- **Task:** a smaller work item needed to complete a story.
- **Backlog:** a list of work items to be prioritised later.
- **Status:** used to track progress, such as To Do, In Progress, and Done.
- No Jira stories or tasks were created during this meeting.

Decisions Made

- Each member will continue researching their selected roles.
- Jira will be used later to organise stories, tasks, and backlog items.
- Members will collect notes, screenshots, and useful tutorial links as Week 2 evidence.
- Role-specific learning should be committed to GitHub in the Week 2 folder.
- Tool installation and familiarisation will continue before the next project planning activities.
