

JobTrack - BRD rough notes (draft before proper doc)

Pooja Tiwari s396163

09 Aug 2026

what is this project

app for tracking job applications. ppl apply on seek/linkedin/indeed/company sites and lose track of what they applied to. so we build a tracker. react + asp.net core + postgres (Trinh's brief).

goal = one place to see all applications + status + interview stuff + dashboard

who uses it

- job seekers (main)
- students
- grads
- migrants
- career changers

rough feature list (from brief)

- add/edit/view/archive/search/filter applications
- status - Applied, Interview, Offer, Rejected, Withdrawn, Archived
- track resume version + cover letter version used
- portfolio / github link per application
- interview date, contact info, follow up date + notes
- dashboard - counts, upcoming interviews, overdue followups, by platform, outcomes

NOT in scope (double check with team):

- no auto email/sms reminders

status flow ??? need to think about this properly

Applied -> Interview -> Offer

Applied -> Rejected

Applied -> Withdrawn

Interview -> Rejected / Withdrawn / Offer

Offer -> withdrawn?? (if user declines) or archived

everything -> Archived at the end i think

Q: can Applied go straight to Offer? probably rare but maybe possible (direct offer no interview) - ask team

Q: can archived be undone? probably yes - need unarchive button

Q: what happens to old status when archived - keep history?? yes probably need a status history log

rough requirements dump

- login/register - private per user obviously
- create application - company, role, platform, date required
- edit application
- archive (not delete straight away)

- delete maybe - with a warning popup
- search by company/role name
- filter by status/platform/date
- record resume version used
- record cover letter version
- portfolio link + github link fields
- interview date(s) - can be more than 1 (multiple rounds)
- contact person name/email/phone for interview
- follow up date + notes
- overdue followup = follow up date passed + nothing done
- dashboard: total active apps
- dashboard: upcoming interviews (next 7 days?)
- dashboard: overdue followups list
- dashboard: status counts
- dashboard: platform counts
- dashboard: outcomes summary - offer/rejected/withdrawn maybe later, not critical

rough user stories - just examples for now

- as a job seeker i want to add a new application so i can start tracking it
- as a job seeker i want to search my apps so i can find one quickly
- as a job seeker i want to update status so it shows where the app is at
- as a job seeker i want to see overdue followups on the dashboard so i remember to contact ppl
- (more to add - ask Trinh/Prince what else they need from BA side)

data / entities - rough idea

User - id, email, password

Application - id, user id, company, role, platform, date applied, status

StatusHistory - old status, new status, date changed

Document - resume version / cover letter version, linked to application

Interview - date, contact info, notes

FollowUp - date, notes, done? y/n

stakeholders - quick list

- Trinh - DBA / Dev
- me - BA / RA
- Prince - DA/ QA

todo before proper BRD

- turn feature dump into numbered FR list w priorities
- draw proper status workflow diagram (maybe use draw.io or the AI tool)
- write acceptance criteria for all user stories
- check scope with Trinh and Prince of team before finalising
- figure out personas properly not just a list
- add doc control table / version history

- format properly in word once content is settled
